- 1. Suppose Host A wants to send a large file to Host B. The path from Host A to Host B has three links, of rates R1=500kbps, R2=2 Mbps, and R3= 1Mbps.
  - a. Assuming no other traffic in the network, what is the throughput for the file transfer?

Course: Network Programming

- b. Suppose the file is 4 mullion bytes. Dividing the file size by the throughput, roughly how long will it take to transfer the file to Host B?
- c. Repeat (a) and (b), but now with R2 reduced to 100 kbps.
- 2. For a P2P file-sharing application, do you agree with the statement, "There is no notion of client and server sides of a communication session"? why or why not?
- 3. What information is used by a process running on one host to identify a process running on another host?
- 4. Suppose you wanted to do a transaction from a remote client to a server as fast as possible. Would you use UDP or TCP? why?
- 5. Why do HTTP, SMTP, and POP3 run on top of TCP rather than on UDP?
- 6. Consider an e-commerce site that wants to keep a purchase record for each of its customers. Describe how this can be done with cookies?
- 7. Describe how web caching can reduce the delay in receiving a requested object. Will web caching reduce the delay for all objects requested by a user or for only some of the objects?
- 8. Consider the following string of ASCII characters that were captured by Wireshark when the browser sent an HTTP GET message (i.e, this is the actual content of an HTTP GET message). The characters <cr><lf> are carriage return and line-feed characters (that is, the italized character string <cr> in the text below represents the single carriage-return character that was contained at that point in the HTTP header). Answer the following questions, indicating where in the HTTP GET message below you find the answer.

```

- a. What is the URL of the document requested by the browser?
- b. What version of HTTP is the browser running?
- c. Does the browser request a non-persistent or a persistent connection?
- d. What is the IP address of the host on which the browser is running?

- Course: Network Programming
- e. What type of the browser initiates this message? Why is the browser type needed in an HTTP request message?
- 9. The text below shows the reply sent from the server in response to the HTTP GET message in the question above. Answer the following questions, indicating where in the message below you find the answer.

- a. Was the server able to successfully find the document or not? What time was the document reply provided?
- b. When was the document last modified?
- c. How many bytes are there in the document being returned?
- d. What are the first 5 bytes of the document being returned? Did the server agree to a persistent connection?
- 10. Consider The below Figure , for which there is an insitutional network connected to the internet. Suppose that the average object size is 850,000 bits and that the average request rate from the institution's browsers to the origin servers is 16 requests per second. Also suppose that the amount of time it takes from when the router on the Internet side of the access link forwards an HTTP request until it receives the response is three seconds on average . Model the total average response time as the sum of the average access delay (that is, the delay from Internet router to institution router) and the average Internet delay. For the average access delay, use  $\Delta$  /(1- $\Delta$  b) where  $\Delta$  is the average time required to send an object over the access link and b is the arrival rate of objects to the access link.

**Course: Network Programming** 

- a. Find the total average response time.
- b. Now suppose a cache is installed in the institutional LAN. Suppose the miss rate is 0.4. Find the total response time.

- 11. Consider distributing a file of F = 15 Gbits to 5 peers. The server has an upload rate of Us=30 Mbps, and peers have download rates di={4 Mbps, 2 Mbps, 1 Mbps, 0.5 Mbps, 400 Kbps}, and the upload rates of the peers are Ui={2 Mbps, 1 Mbps, 1 Mbps, 0.5 Mbps, 200 Kbps}. Considering Client-server model, calculate the minimum distributed time.
- 12. Repeat problem 11, considering P2P model.
